

Consumer Platforms

Turning digital products into everyday value

EdTech • Wellness • Travel • Home Services • Media • Lifestyle

Digital products and intelligent platforms for consumer businesses

Most consumer platforms do not have a feature problem. They have a value-realisation problem.

01

Acquisition without intent

Traffic and installs grow,
but too few people arrive
with a clear reason to act.

02

Sign-up without activation

Users complete
onboarding but do not
reach the first meaningful
outcome quickly.

03

Usage without habit

People try the product, yet
do not build a reason to
return regularly.

04

Engagement without value

Time spent or content
consumed does not
reliably translate into
retention or revenue.

The constraint is not access to technology. It is how quickly and consistently the platform creates value for the user—and for the business.

Across categories, consumer-platform leaders are trying to improve the same five outcomes.

01

Acquire

Bring in more relevant users at a sustainable cost.

02

Activate

Help users reach the first meaningful value faster.

03

Engage

Create repeat behaviours around useful moments.

04

Retain

Give users a continuing reason to return and stay.

05

Monetise

Convert value into subscriptions, transactions or deeper usage.

These outcomes form one connected system: weak activation makes engagement expensive; weak engagement makes retention and monetisation fragile.

Value leaks at predictable moments in the consumer lifecycle.

The opportunity is to find the highest-value leak, redesign the behaviour around it, and measure whether the business outcome moves.

Why consumer platforms struggle to create sustained usage.

01

Unclear proposition

The product explains features before making the core value unmistakable.

02

Generic onboarding

Every user gets the same path, regardless of intent or readiness.

03

Feature-led structure

Navigation reflects the product catalogue—not what the person is trying to achieve.

04

Value arrives late

The platform asks for data, setup or commitment before delivering a useful outcome.

05

Static experiences

The same screens, content and prompts appear despite changing context and behaviour.

06

Weak learning loop

Teams ship features but cannot clearly connect usage signals to the next product decision.

Our response: three consumer-platform offerings tied to business outcomes.

01

New Product & Platform Ventures

Create, validate and launch differentiated consumer products.

Proposition • Product strategy • Concept
• Prototype • MVP

02

Adoption & Retention Growth

Increase activation, repeat use, retention and lifetime value.

Onboarding • Core journeys • Habits •
Lifecycle engagement • Experimentation

03

Intelligent Platform Evolution

Make the product more adaptive, useful and commercially effective over time.

Personalisation • Recommendations • AI
guidance • Next-best actions • Optimisation

A polished launch cannot compensate for a weak product proposition.

What the business experiences

- Slow movement from idea to validated proposition
- Large design-and-build investment before user learning
- Products that resemble category competitors
- Post-launch ambiguity about what to improve

Why it persists

- The brief begins with a solution, not an unmet need
- Research, product, design and engineering happen sequentially
- Teams validate usability but not willingness to return or pay
- MVPs become smaller versions of a full product, not sharper tests

The opportunity: prove the proposition, the key behaviour and the path to value before scaling the platform.

BOMBAYDC response: create the smallest credible product that proves the business idea.

Opportunity framing

Define the unmet need, business model and target behaviour.

Proposition design

Make the reason to choose, use and return unmistakable.

Intent-led journeys

Organise the product around what the consumer is trying to achieve.

Prototype validation

Test comprehension, usefulness and behavioural pull before build.

MVP design and build

Launch a focused product with the core experience and required integrations.

Measurement foundation

Instrument the journeys and signals that matter from day one.

Business outcome: faster validation, clearer differentiation and lower risk before scale.

Sign-ups and downloads do not become repeat use by themselves.

What the business experiences

- High onboarding drop-off
- Low use beyond one or two obvious features
- Engagement falls after the initial need is met
- Notifications create activity but not durable value
- Churn remains difficult to explain or reverse

Why it persists

- Users do not reach first value quickly enough
- The product does not recognise different intents
- Feature discovery depends on menus or campaigns
- Return triggers are generic rather than contextual
- Teams optimise screens instead of the full behaviour loop

The opportunity: design activation, habit and retention into the product—not as communication added after launch.

BOMBAYDC response: make the platform useful sooner, easier to return to and harder to replace.

Activation redesign

Shorten the path from sign-up to the first meaningful outcome.

Core journey simplification

Remove friction from the moments that create repeat value.

Intent and context

Adapt entry points and guidance to the user's immediate goal.

Habit loops

Connect useful triggers, actions and rewards without relying on empty gamification.

Lifecycle engagement

Use milestones, lapses and changing needs to shape the next action.

Product experimentation

Measure behaviour, test interventions and improve continuously.

Business outcome: higher activation, meaningful engagement, retention and customer lifetime value.

Static consumer journeys are giving way to platforms that learn and adapt.

Static platform

- Same onboarding for everyone
- Fixed navigation and journeys
- Generic content and offers
- Rules decided largely in advance
- Teams react after performance declines

Intelligent platform

- Understands intent and context
- Adapts guidance and next steps
- Recommends relevant content or actions
- Detects friction and lapse signals
- Improves through behaviour and outcome data

AI matters when it changes the behaviour of the platform—not merely when it adds a chatbot.

The same growth problems appear differently across six consumer categories.

EdTech

Learner activation • Progress •
Completion • Renewal

Wellness

Habit formation • Adherence •
Personalisation • Trust

Travel

Discovery • Decision confidence •
Booking • Trip servicing

Home services

Matching • Availability • Trust •
Repeat booking

Media

Content discovery • Session depth
• Subscription • Churn

Lifestyle

Inspiration • Community •
Commerce • Loyalty

The category changes. The work remains focused on helping people reach value, repeat the behaviour and deepen the relationship.

Diagnose the leak, prove the experience, then build for scale.

01

3 days

Strategic concept

Frame the business problem, target behaviour, product idea and highest-value journeys.

02

3 weeks

Working prototype

Design and validate the proposition, experience logic and critical moments before full build.

03

3 months

Focused MVP

Build the core product, integrations and measurement foundation needed to launch and learn.

Strategy, behaviour, design, engineering and data work together from the beginning—so learning happens before the biggest commitments are made.

Build consumer platforms people choose, use and return to.

Increase activation. Build habits. Improve retention. Grow revenue.
