

ECOMMERCE POV

Ecommerce investment does not always translate into profitable growth.

We help commerce businesses increase conversion, grow basket value, improve retention and modernise the platforms that power growth.

Business outcomes first. Design and technology as the means.

Four outcomes define ecommerce performance.

Commerce leaders do not buy a storefront. They invest in better business performance.

Increase conversion

Turn more qualified discovery and product interest into completed purchases.

Grow AOV and margin

Increase relevant cross-sell, bundles, category penetration and premiumisation.

Improve retention and CLV

Create repeat purchase, stronger loyalty and greater value per customer.

Increase platform agility

Improve speed, scalability, release cycles and control across web, app and store.

For premium brands, stronger brand expression is not a separate cosmetic goal.

It improves confidence, conversion quality and pricing power across all four outcomes.

BRAND

CONTENT

Commercial value leaks across the full commerce journey.

The platform has to help customers discover, decide, buy, return and grow in value.

The constraint is rarely a lack of features. It is the gap between customer intent, platform behaviour and commercial outcomes.

The same journey must work across web, mobile app, store-associate and service touchpoints.

Why conversion and basket growth underperform

Traffic and product availability do not automatically create confident decisions or valuable baskets.

What the business experiences

- High traffic but low purchase conversion
- Heavy drop-off on product and cart pages
- Customers buy only the item they came for
- Premium and higher-margin categories remain hidden

Why it persists

- Navigation reflects the catalogue, not customer intent
- Product pages inform but do not create confidence
- Recommendations are generic or poorly timed
- Cross-sell follows product links, not customer needs

The opportunity: turn discovery, product choice and merchandising into one guided purchase system.

Our response: Conversion and Intelligent Merchandising

Business outcomes: higher purchase conversion, AOV and margin quality.

Intent-led discovery

Organise navigation, search and landing journeys around customer needs.

Confidence-rich PDPs

Clarify fit, value, evidence, delivery, returns and product choice.

Comparison and guidance

Help customers evaluate complex choices with less effort.

Contextual recommendations

Recommend around intent and context, not only catalogue adjacency.

Bundles and complete solutions

Make useful combinations easier to understand and purchase.

Intelligent cart and checkout

Remove completion friction and introduce relevant additions.

Why customers do not return often enough

A first purchase creates sustainable value only when the relationship continues after checkout.

What the business experiences

- High dependence on paid acquisition
- Low repeat purchase and reorder rates
- Weak account and loyalty engagement
- CRM campaigns produce inconsistent results

Why it persists

- The experience largely ends after purchase
- Returning customers see the same storefront
- Loyalty is reduced to points and discounts
- Communication is campaign-led rather than need-led

The opportunity: connect post-purchase, replenishment and lifecycle moments into one relationship.

Our response: Retention and Customer Value

Business outcomes: stronger repeat behaviour, retention and CLV.

Post-purchase experience

Turn delivery, service and product use into relationship moments.

Replenishment journeys

Remove effort from recurring needs and repeat buying.

Loyalty and membership

Design recognition and benefits that change behaviour.

Account and orders

Give customers a useful home for the ongoing relationship.

Lifecycle journeys

Respond to behaviour and customer moments with relevant actions.

Personalised reminders

Make returning feel recognised, timely and useful.

Why the platform struggles to evolve

Platform complexity slows experimentation, execution and the return on digital investment.

What the business experiences

- Slow page performance and release cycles
- Heavy dependence on technology teams
- Campaigns and market changes take too long
- Inconsistent experiences across web, mobile, store and assisted channels

Why it persists

- Experience and technology evolved separately
- Custom components and workarounds accumulated
- Merchandising teams lack usable controls
- Legacy architecture restricts testing and scale

The opportunity: make the commerce platform faster to use, change, experiment with and scale.

Our response: Commerce Platform Modernisation

Business outcomes: faster experience, faster change and stronger operating control.

Experience and platform audit

Prioritise constraints that most affect growth and delivery.

Design systems

Create a consistent and reusable language across journeys.

Omnichannel and associate tools

Connect web, mobile apps, store-associate interfaces and kiosks.

Performance optimisation

Improve speed and responsiveness across critical journeys.

Content and merchandising tools

Give business teams usable control over commerce content.

Experimentation foundations

Make measurement, learning and optimisation part of delivery.

The full commerce loop

The best commerce systems create value across discovery, conversion, repeat purchase and loyalty - not just checkout.

01 DISCOVERY

Help customers find the right product, understand the brand and enter the right journey.

Moves: quality traffic, product discovery

02 CONVERSION

Reduce hesitation through stronger product confidence, merchandising and completion.

Moves: conversion, AOV, abandonment

03 REPEAT PURCHASE

Use post-purchase, replenishment and recommendations to create return behaviour.

Moves: repeat rate, revenue per customer

04 LOYALTY AND LIFECYCLE

Build recognition, rewards, access and relevance around customer value.

Moves: retention, CLV, participation

Premium commerce is a full-loop performance problem.

AI-era commerce features worth building

The point is not AI-powered commerce. The point is features that move real commerce KPIs.

Guided product discovery

Conversational or wizard-led journeys that help customers find the right product faster.

Moves: discovery, conversion

Personalised recommendations

Next-best products, bundles and edits based on browsing, purchase and context.

Moves: AOV, repeat purchase

Smarter offers

Target incentives using behaviour, order value and comeback probability.

Moves: conversion, comeback rate

Loyalty intelligence

Make tiers, rewards and recognition relevant to actual customer value.

Moves: CLV, retention

Lifecycle triggers

Use replenishment, reorder, win-back and seasonal signals to prompt action.

Moves: repeat purchase

AI-led content operations

Use AI to accelerate catalogue enrichment, tagging, copy variants and campaign adaptation.

Moves: speed, merchandising quality

Capabilities across the commerce stack

We can deliver the complete commerce system or focus on the capability that unlocks the next business outcome.

Commerce strategy and experience

Business diagnosis, customer research, UX, UI, design systems and conversion journey design.

Full commerce and omnichannel build

Web, mobile apps, store-associate tools, kiosks, platform implementation and integrations.

AI and intelligent features

Guided discovery, recommendations, assistants, automation and content intelligence.

Content, imagery and video

Content strategy, product storytelling, imagery, video and campaign assets.

Analytics and experimentation

Measurement strategy, instrumentation, funnels, dashboards, testing and optimisation.

Martech implementation

CleverTap and engagement-platform implementation, segmentation, triggers and lifecycle automation.

Performance marketing and SEO

Paid acquisition, search visibility, campaign journeys, content distribution and conversion optimisation.

Commerce operations and integrations

Payment gateways, OMS, inventory, fulfilment, shipping, delivery, returns and refunds.

One partner across strategy, content, experience, technology, intelligence and growth operations.

Why BombayDC

We combine the disciplines required to move from a commercial problem to a working commerce system.

Commerce systems, not pages

We think across discovery, conversion, retention, loyalty, omnichannel operations and platform agility.

Brand and content as performance levers

We use positioning, storytelling and merchandising to improve confidence and value.

Integrated design and technology

The final build preserves the experience and commercial logic.

Strategy through implementation

Research, behaviour, design, engineering, data and content work around one outcome.
