

Reducing Friction in Complex B2B Platforms

A point of view on how enterprise B2B platforms need to evolve in the AI era - and what it takes to build them.

Digital platforms for the AI era

For enterprise sales conversations

Most B2B platforms are functional - but underperforming.

The issue is rarely the absence of features. It is experience friction across complex workflows.

- Adoption is lower than expected
- Sales and service teams still work around the platform
- Customers and partners depend on humans for basic tasks
- Dashboards show data, but do not support decisions

What this creates

Slow deal velocity
Higher support dependency
Lower self-serve confidence
Poor ROI from existing systems

The pattern

Many B2B platforms are technically capable, but commercially under-leveraged.

What B2B leaders actually want from the platform

These are business expectations - not design asks.

Higher adoption

More users doing more meaningful tasks inside the platform

Lower sales friction

Shorter paths from intent to action across customer and partner journeys

More self-serve

Fewer routine tasks routed through human teams

Better partner productivity

Partners can sell, order, and resolve with less support

Better ROI from current systems

More value from the existing tech stack without a full rebuild

Why most B2B platforms fail to deliver those outcomes

The friction sits across workflows, systems, and constraints - not only screens.

Complex workflows

Multiple roles, approval paths, pricing rules, and non-linear journeys.

Fragmented systems

Sales, onboarding, ordering, service, and account management live across disconnected tools.

Legacy constraints

Teams cannot always change backend workflows quickly, even when the experience needs to improve.

Inconsistent UX patterns

Different modules behave differently, increasing learnability cost and confusion.

Decision overload

Platforms show information, but do not clarify what matters or what to do next.

What those outcomes now demand from the platform

When the business outcome changes, the platform has to change - and so does the way it is built.

Platform now needs to be...

- Clearer for different roles
- Task-oriented across workflows
- Better at guiding decisions
- Adaptive to context and usage
- Easy to improve continuously

This means...

The platform must move beyond transactions and become a decision and workflow system for the business.

Therefore...

It requires a new product model - not just a redesign.

Enterprise B2B platforms were built for a transactional era.

Today they need to be more adaptive, intelligent, and performance-led.

Then

- Static interfaces
- Fixed workflows
- Data-heavy dashboards
- Sequential design and build cycles
- Launch-focused delivery

Now

- Adaptive experiences
- Decision-supportive workflows
- Context-aware surfaces
- Parallel product workstreams
- Continuous optimisation

Intelligence is the new design fabric.

How we design and build for this new reality

Our model is built to solve the exact platform problems enterprises face today.

1. Intelligent products

Platforms that respond to behavior, reduce friction, support decisions, and make complex workflows easier to navigate.

2. A parallel lifecycle

Strategy, design, and engineering run together - reducing risk, accelerating learning, and improving alignment.

3. A new team model

Business, behavior, design, data, and engineering come together from day one to build more relevant platforms.

From idea to validated product, faster and with less risk

A lifecycle designed for enterprise platforms that need continuous learning and phased evolution.

New team structure

Representative B2B platform case

A real enterprise platform redesign shaped under legacy and workflow constraints.

Situation

A global B2B platform used for onboarding, ordering, service management, and account visibility needed to improve adoption across customers and internal sales teams.

Constraint

Core backend workflows could not be changed immediately. Any redesign had to work inside phased rollout and existing architecture realities.

Intervention

Started with UI, usability, and heuristic audits. Then redesigned the UI, built a scalable design system, and fixed all UI issues plus around 50% of usability issues not blocked by backend constraints.

Why it matters

Shows how adoption can improve without waiting for full backend transformation.

Why enterprises work with us

A strategic digital platform firm shaping how enterprises operate in the AI era.

- We simplify complex enterprise systems
- We operate within real-world constraints
- We combine strategy, UX, and engineering
- We design for adoption, not just aesthetics
- We create scalable foundations, not one-off redesigns

Trust signals

98% on-time delivery
Dedicated staffing
In-house technology team
Enterprise constraints handled
Design-to-tech integrated delivery

B2B platforms can no longer be treated as portals.

They are now core systems for revenue, service, and decision-making.

Let's talk about where friction is holding your platform back.
