

ENTERPRISE PLATFORMS

Enterprise platforms do not always
translate digital investment into business
performance.

We help enterprises accelerate revenue, increase productivity, reduce cost to serve and modernise the platforms that power operations.

Business outcomes first. Experience, intelligence and technology as the means.

BUSINESS OUTCOMES

Four outcomes define enterprise platform performance.

Leaders do not invest in portals. They invest in stronger business performance.

Accelerate revenue

Shorten discovery, configuration, quotation, approval, ordering and onboarding.

Velocity

Increase productivity

Help customers, partners and employees complete more meaningful work with less effort.

Completion

Reduce cost to serve

Resolve more routine needs through guided self-service and intelligent assistance.

Efficiency

Increase platform agility

Improve speed, consistency, release cycles and control across the product estate.

Adaptability

Adoption is not a separate outcome. It is evidence that the platform is helping users create value.

WHERE VALUE LEAKS

Value leaks across the complete enterprise platform lifecycle.

The same platform must help users discover, decide, transact, operate, resolve and grow.

The constraint is rarely a lack of features. It is the gap between user intent, platform behaviour and business outcomes.

BUSINESS PROBLEM 01

Why revenue workflows remain slow and fragmented

Complex products, pricing, approvals and onboarding turn digital journeys into assisted processes.

What the business experiences

- 01 Sales teams compensate with offline coordination
- 02 Customers struggle to select and configure the right solution
- 03 Quotes and approvals take too long to progress
- 04 Onboarding and order status require manual follow-up

Why it persists

- 01 Navigation follows the product catalogue, not customer intent
- 02 Rules and dependencies are exposed instead of resolved
- 03 Pricing, CRM, ordering and fulfilment sit across systems
- 04 The platform reports status but does not remove blockers

The opportunity: turn discovery, configuration, approval and onboarding into one guided revenue workflow.

BOMBAYDC RESPONSE

Digital Sales and Transaction Acceleration

Guide customers and teams from business need to completed transaction with less delay.

Business outcomes: shorter sales cycles, higher completion and lower assisted-sales effort

Intent-led discovery

Begin with the user goal and context, not the enterprise product hierarchy.

Guided configuration

Translate requirements into relevant solutions, options and dependencies.

Quote and approval flows

Simplify pricing, documents, approvals and hand-offs across teams.

Assisted selling

Give sales teams account context, recommendations and next-best actions.

Ordering and onboarding

Connect commitment, fulfilment, activation and early-life support.

Revenue intelligence

Identify stalled journeys, likely blockers and high-value interventions.

BUSINESS PROBLEM 02

Why customers and partners still depend on people

A functional platform can still create support dependency when workflows are difficult to understand or complete.

What the business experiences

- 01 Users call sales or service for routine tasks
- 02 Partners need help to order, track and resolve
- 03 Important capabilities remain undiscovered
- 04 Account teams become the interface to the platform

Why it persists

- 01 Different roles see the same information and workflows
- 02 Modules use inconsistent patterns and terminology
- 03 Self-service provides forms, not guidance
- 04 Account and service context does not carry across journeys

The opportunity: make the platform a productive workspace for customers, partners and service teams.

BOMBAYDC RESPONSE

Customer, Partner and Service Productivity

Design role-aware workspaces that make important tasks clearer, faster and easier to resolve.

Business outcomes: higher productivity, stronger self-service and lower support dependency

Role-based workspaces

Prioritise relevant tasks, decisions and context for each user role.

Guided self-service

Turn routine service and account tasks into clear completion journeys.

Partner enablement

Support selling, ordering, tracking and issue resolution in one place.

Account intelligence

Surface commitments, usage, opportunities, risks and recommended actions.

Service copilots

Help users and employees understand issues and complete resolution workflows.

Contextual routing

Carry the right history and evidence when human assistance is required.

BUSINESS PROBLEM 03

Why teams have data, but struggle to decide and act

Dashboards describe the platform. They rarely explain what matters, why it matters or what to do next.

What the business experiences

- 01 Teams monitor multiple dashboards and alerts
- 02 Risks surface after service or revenue is affected
- 03 Users investigate issues across tools and teams
- 04 Approvals slow because impact and evidence are unclear

Why it persists

- 01 Data is organised by system rather than business goal
- 02 Signals are reported without context or prioritisation
- 03 Analytics is separated from the workflow that acts on it
- 04 Recommendations do not show cost, risk or confidence

The opportunity: turn operational signals into prioritised decisions, guided action and verified outcomes.

BOMBAYDC RESPONSE

Intelligent Operations and Decision Support

Help teams understand what needs attention, choose the right action and follow it through to impact.

Business outcomes: faster decisions, fewer preventable issues and more consistent operations

Intent-led command centre

Organise the experience around goals, priorities and decisions - not products.

Proactive risk signals

Predict delays, capacity issues, service risks and account opportunities.

Explainable recommendations

Show why an action is recommended, expected impact, cost and confidence.

Guided diagnosis

Connect telemetry, history and context to identify likely causes and options.

Approval and automation

Separate recommendations, approval-ready actions and safe automation.

Outcome verification

Compare actual results with the intended outcome and recommend what comes next.

BUSINESS PROBLEM 04

Why the platform becomes harder to change over time

Experience, technology and operations accumulate complexity faster than the platform can absorb it.

What the business experiences

- 01 Release cycles slow as dependencies increase
- 02 Experiences vary across modules, roles and channels
- 03 Business teams depend heavily on technology teams
- 04 Investment shifts from improvement to maintenance

Why it persists

- 01 Point solutions and workarounds accumulate
- 02 Design and engineering evolve separately
- 03 Legacy systems constrain journey-level change
- 04 Measurement and experimentation arrive after launch

The opportunity: create a modular, measurable platform that can improve without requiring a full reset.

BOMBAYDC RESPONSE

Platform Modernisation and Performance Intelligence

Improve experience and platform foundations in the sequence that creates the most business value.

Business outcomes: faster change, stronger control and better return on existing platform investment

Platform diagnosis

Identify the journeys, constraints and value leaks that matter most.

Experience architecture

Create coherent journeys, navigation and patterns across roles and modules.

Design systems

Build reusable foundations that increase consistency and delivery speed.

Front-end modernisation

Improve high-value journeys while working within backend realities.

Journey instrumentation

Measure behaviour, completion, friction and operational impact.

Experimentation system

Make prioritisation, testing and continuous optimisation part of delivery.

AI AND ANALYTICS

Analytics identifies friction. AI helps the platform respond.

Together they create a closed loop from signal to action to measurable improvement.

The goal is not to add AI to the platform. It is to help more users decide, act and complete successfully.

THE PLATFORM SHIFT

Intelligent platforms behave differently.

Intelligence matters when it changes how the platform understands context and responds.

MOST PLATFORMS TODAY

- 1 Show the same workspace to every role
- 2 Wait for users to search and interpret
- 3 Report issues after they occur
- 4 Separate insight from the workflow
- 5 Escalate when self-service fails

INTELLIGENT PLATFORMS

- 1 Adapt to role, intent and operating context
- 2 Surface the likely next need or action
- 3 Anticipate risk and recommend intervention
- 4 Embed decisions, approvals and action together
- 5 Guide, resolve or route with context

OUR CAPABILITIES

Capabilities across the enterprise platform stack

We can address the complete platform or focus on the layer that unlocks the next business outcome.

Product strategy

Business diagnosis, research, proposition, roadmap and outcome definition.

Behaviour and experience

User research, behavioural science, journey design, UX, UI and design systems.

AI, data and intelligence

Signal design, assistants, recommendations, prediction, analytics and experimentation.

Engineering and integration

Front-end, full-stack, APIs, workflow integration and platform modernisation.

Content and communication

Product language, knowledge, service content and AI-assisted content operations.

One integrated team across business, behaviour, design, intelligence and technology.

REPRESENTATIVE EXPERIENCE

Improving a complex platform within real constraints

A multi-role platform spanning onboarding, ordering, service management and account visibility.

SITUATION

Customers and internal sales teams used a global enterprise platform across high-value workflows.

CONSTRAINT

Core backend workflows could not change immediately; improvement had to support phased rollout.

INTERVENTION

We combined UI, usability and heuristic audits with journey redesign and a scalable design system.

WHAT IT SHOWS

Enterprise platforms can improve adoption and task completion while the deeper transformation evolves.

The value is not a cosmetic redesign. It is a clearer path from user intent to business completion.

Where is platform value leaking most in your business?

Revenue velocity / Customer and partner productivity / Decision quality / Platform agility

Let us identify the highest-value journeys to improve first.

Enterprise platforms should not only manage transactions. They should help the business decide, act and improve.
